

A potential hardship I will face while taking this class is being patient. I have looked for a job for over a year in my aerospace field and I am eager to learn everything I can about programming so that I can become employable. While making the Scratch game, I became very frustrated since I hadn't read and understood all of the available tools to use. I also tried to add too many features too early and the task became a mess. I started over and this time with more knowledge of available tools and I also did the bare bones first. After I added the cool features later, I was very pleased with the result. I just needed patience.

Another part of patience is with the program as a whole. Almost all YouTube links are disconnected and Zoom video emails don't include links. Calling someone takes a very long time and so I must be patient and do everything very early so that if I run into problems then there is enough time to get a response from a helper.
